

Tips for using Electronic Cigarettes

Always fully charge new batteries before using for the first time.

Screwing a battery into the charger too tight can damage the battery by pushing the center post of the battery in, then it will not contact the atomizer or cartomizer center post

If liquid gets into the switch area of the battery it will cause the switch to fail. This can be avoided by never over filling a cartomizer or installing a refilled cartomizer without letting it sit standing up for a short time to allow any excess liquid to run out. You can also blow through a refilled cartomizer to make sure there is no liquid in the center tube.

When using a tank system of any type avoid setting or storing the device in an upright position. The wicking system will continue to feed liquid to the atomizer causing a leak or flooding the atomizer.

Using straight VG e-liquid will not allow the wicking of liquid to supply the atomizer with enough liquid for heavy use due to the thicker viscosity. Best to use a mix of PG & VG, at least 50% PG is good.

When using any type of mod with replaceable batteries always insert the battery with the correct polarity as per the instructions.

To use a cartomizer drip tip hold it at a slight angle & drip in 8-10 drops while rotating. Wait a few minutes install on a battery and enjoy

To fill a CE4 Clearomizer unscrew the mouthpiece and pull it out of the body. Use a needle tip bottle filled with e-liquid and insert the needle between the silicone ring and transparent body. Squeeze the bottle to fill with liquid up to the silicone ring then remove the needle and replace the mouthpiece. Wait a short time to allow the wick to feed liquid to the atomizer and enjoy.

Proper Refilling of Cartomizers

- 1: Remove the white cap at end of Cartomizer, remove the washer inside of Cartomizer. (some will not have the washer)
- 2: , hold the cartomizer at a slight angle so you don't get fluid in the center hole and put in about eight drops of e-liquid while turning the cartomizer to get liquid around the batting evenly.
- 3: Set the cartomizer down standing up on the threaded end and leave it sit for at least twenty minutes to allow the liquid to soak in.
- 4: Repeat step 2 with another eight drops.
- 5: Replace the washer with bevel side down and replace the white end cap. It is best at this point to stand the Cartomizer up on the threaded end for at least an hour or two before using again to allow the liquid to fully soak in. Before installing a refilled cartomizer on a battery make sure there is no liquid leaking from the threaded end. This can damage a battery or switch.

We recommend filling three or more at a time then install the seals to have a supply of filled cartomizers on hand.

Although there are many ways shown on UTUBE to refill cartomizers we feel this method has less waste and less cleanup.
