

EGO 3 VV Variable Voltage electronic cigarette Mod features:

The EGO 3 VV is the first budget variable voltage tube mod! It uses a 18650 battery and works at voltages from 3.0 to 6.0 in increments of 0.1v.

The EGO VV Mod is a sturdy device made of metal alloy with a black painted finish.

The EGO VV Mod comes with a standard 510 style connector. You can even use eGo style skirted atomizers as long as you buy a 510-eGo adapter.

On the EGO VV body you have 4 buttons;

Power button (Red): Hold this down for 5 seconds to turn the device on/off.

Fire button (Black): Once powered on the fire button will activate your atomizer at the set voltage.

Voltage adjustment buttons (black): Use the + and - buttons to adjust the voltage in 0.1v steps. Once 6.0 is reached the voltage will step back to 3.0 if you push the + button again.

The LCD screen is simple, easy to read and backlit with a red LED. It simply displays the voltage as you set/change it using the voltage set buttons.

In addition the EGO VV has a "lock" feature. Simply push and hold the 2 black voltage adjustment buttons at the same time for 5 seconds and it will lock the voltage. This is great as it means you can't accidentally change the voltage!

Ample safety! The EGO VV Mod comes with built in circuit/switch protection. This means that you cannot push the switch over 2.5amps of load. The great thing about this is that rather than simply not working or displaying an error the EGO VV will automatically put the voltage down to an acceptable level and carry on working!

The EGO VV also has regulated voltage output which keeps the voltage exactly the same each time you use it. As your 18650 battery continues to drain the EGO VV regulated voltage will always output at the same level!

Activation protection cuts in at 10 seconds. This means if you try and use the EGO VV for longer than 10 seconds it will simply cut off in order to protect you and your atomizers!

Reverse battery protection - Don't know your negative from your positive? Don't worry if you put the battery in the wrong way the device simply won't work. In addition if your battery becomes discharged the EGO VV will protect itself and your battery by shutting off.

With 1600 mAh of power, the EGO 3 VV keeps you vaping for days at any voltage level.

The EGO 3 VV e-cig uses a 18650 battery, which is a standard size but it is strongly recommended that you purchase replacement batteries only directly from AZ Smoke Free as third-party batteries may not work properly. The 18650 battery included with the EGO 3 VV has a flat top — a standard button-top battery will not fit properly. Finally, using a third-party battery with the EGO 3 VV may void your warranty. AZ Smoke Free sells replacement batteries for the EGO 3 VV that are correct.

Congratulations on your purchase of an EGO 3 VV (Variable Voltage) e-cigarette from AZ Smoke Free. These instructions will help you through the process of setting up and using the EGO 3 VV for the first time. We also want to help you keep your EGO 3 VV e-cig in top condition.

Setting Up the EGO 3

The EGO 3 VV battery comes from the factory with a slight charge. Insert the battery in the charger and wait for the charger's light to turn green before using your EGO 3 VV for the first time. Your patience will be rewarded. Charging the battery for the first time should take about three hours, while subsequent charges take about six hours. The positive side of the battery has a dark ring; this side should face up in the

charger as well as in the EGO 3 VV e-cig itself.

When the battery finishes charging, turn the bottom cap of the EGO 3 VV counter-clockwise to remove it. Insert the battery with the positive side facing up, and replace the bottom cap. You should see the screen light up, indicating that the e-cig is on. If it doesn't, hold the red power button for five seconds. The EGO 3 VV always starts with a default setting of 3.0 volts.

Insert a 510 atomizing device into the threading at the top of the e-cig and turn it clockwise to tighten it. Make sure you always keep your atomizing device full of e-liquid.

Using the EGO 3VV

Use the + button to set the voltage to 4.0 as a starting point. Your EGO 3 VV came with several types of atomizing devices. If using the atomizer and drip tip, put 3-4 drops in the drip tip mounted on the atomizer and Push the large black fire button while taking long slow puffs. If using the cartomizer drip tip put 5-6 drops into the mouth piece while holding the EGO 3 VV at a slight angle, then press the fire button while taking long slow puffs. You may use any 510 atomizing device or cartomizer on the EGO 3.

Changing the Voltage

After you become accustomed to using the EGO 3, raise the voltage slowly with the "+" button until you find the level that is right for you. The 3.0 ohm atomizer included with the EGO 3 works at all power levels up to 6.0 volts. At the maximum voltage level, the EGO 3 produces a great deal of power. If you taste burned flavors lower the voltage slightly until you are satisfied. When you find the right voltage level, hold both buttons until the screen blinks. The voltage setting is now locked and cannot be changed accidentally. To unlock the voltage, hold both buttons until the screen blinks again.

Atomizer Resistance

When shopping for atomizers, you may have noticed that they come in three categories: low, standard and high-resistance. These atomizers are rated at approximately 1.5, 2.5 and 3.0 ohms respectively. The EGO 3 works with atomizers at all resistance levels. It is generally best to use a high-resistance atomizer; low-resistance atomizers are not designed for high-voltage e-cigs such as the EGO 3. Rather, they are designed to increase the amount of vapor that a 3.7-volt e-cig can produce. At 6.0 volts, a low-resistance atomizer would be soon burnt out. To prevent this from happening, the EGO 3 includes a limiter that automatically drops the voltage when a low-resistance atomizer is connected.

Battery Maintenance

Follow these tips to extend the life of the EGO 3's battery:

- Charge every new battery fully before using it.
- Use your EGO 3 and charge the battery at least once per month. If you put the EGO 3 into storage, remind yourself to charge the battery.
- Keep the battery out of extreme temperatures. Using the EGO 3 in environments colder than 32 degrees and hotter than 95 degrees Fahrenheit can reduce battery's performance.
- Hold the power button for five seconds to turn the EGO 3 off when you aren't going to use it for a while. This eliminates the possibility of accidentally pushing the fire button and draining the battery.
